Financial Statement Analysis
Accounting 510

This course focuses on using financial statements and a variety of other information about firms to aid in forecasting and investment decision making. The course takes a practitioner approach in applying financial statement analytical tools and valuation theory.

Students interested in capital markets, investment banking, venture capital, private equity, corporate strategy, financial planning and analysis, and consulting will find the course most relevant. The course instructor builds the curriculum around real-time capital market events and cases he has hands on experience with from a 15-year career as an equity analyst and hedge-fund portfolio manager.

Case-Based
The course utilizes cases from capital markets to illustrate the course material with modern examples from the investment industry.

Current Events
The instructor will allocate significant time throughout the course to classroom discussions about current events in capital markets relevant to the course material.

Team Project
Work in teams throughout the quarter to produce a final deliverable: a sell-side style investment report and presentation to the class.
